Problem CSIR UGC NET EXAM (Dec 2016), Q.51:

Suppose customers arrive in a shop according to a Poisson process with rate 4 per hour. The shop opens at 10 : 00 am. If it is given that the second customer arrives at 10 : 40 am, what is the probability that no customer arrived before 10 : 30 am?

1) $\frac{1}{4}$ 2) e^{-2} 3) $\frac{1}{2}$ 4) $e^{\frac{1}{2}}$

Solution:

Let X denote the random variable for the time interval, and it is divided as:

$$p = 10:00 - 10:30$$
$$q = 10:30 - 10:40$$
$$r = 10:00 - 10:40$$

At the instant of 10 : 40, let the random variable be Y. We need to find

$$\Pr\left(X_p = 0 | Y = 2\right) \tag{0.0.1}$$

In the world where the 2^{nd} person arrives at 10 : 40 am the (0.0.1) becomes:

$$= \frac{\Pr\left(X_p = 0, X_q = 1\right)}{\Pr\left(X_r = 1\right)} \tag{0.0.2}$$
$$= \frac{\Pr\left(X_p = 0\right) \times \Pr\left(X_q = 1\right)}{\Pr\left(X_r = 1\right)} \tag{0.0.3}$$

The Poisson function distribution for time interval t and rate λ for a random variable X:

$$f_X(x;t) = \frac{(\lambda t)^x \exp\left(-\lambda t\right)}{x!}$$

For the time interval p:

$$\lambda = 4, t = 0.5, x = 0 \tag{0.0.4}$$
$$\Pr\left(X_p = 0\right) = f_X(0; 0.5) \tag{0.0.5}$$
$$= e^{-2} \tag{0.0.6}$$

For the time interval q:

$$\lambda = 4, t = \frac{1}{6}, x = 1 \tag{0.0.7}$$
$$\Pr\left(X_q = 1\right) = f_X(1; \frac{1}{6}) \tag{0.0.8}$$
$$= \frac{2}{3} e^{\frac{-2}{3}} \tag{0.0.9}$$

For the time interval r:

$$\lambda = 4, t = \frac{2}{3}, x = 1 \tag{0.0.10}$$
$$\Pr\left(X_r = 1\right) = f_X(1; \frac{2}{3}) \tag{0.0.11}$$
$$= \frac{8}{3} e^{\frac{-8}{3}} \tag{0.0.12}$$

Substituting (0.0.6) (0.0.9) (0.0.12) in (0.0.3):

$$\Pr\left(X_p = 0 | Y = 2\right) = \frac{1}{4} \tag{0.0.13}$$

Hence, **Option 1** is correct
